

Little Blue Stem

Schizachyrium scoparium

-Little Blue Stem is a native prairie grass. Like most all prairie grasses it has a tremendously deep root system.

-The roots will help prevent any soil erosion around it.

-The stems turn a delicate blue to purple around midsummer.

-Little Bluestem is a proven winner on our shoreline restoration sites. One of the reasons that we like to plant it revolves around the fact that it is such a wonderful soil stabilizer, however it takes a while for this plant to establish itself.
