

# Switchgrass

*Panicum virgatum*

-Switchgrass is excellent for winter wildlife cover. This ever-popular grass is known for its lush foliage and conical seedheads that turn golden brown in fall. It is also the best native grass for creating dense cover for wildlife habitat. Its stiff stems stand up over winter better than all the other grasses.

-Switchgrass is at home on almost any soil. It can grow to heights of 3-6 feet in height in even the driest soils or the most horrendous clays. Also grows luxuriantly on good soil. Provide excellent wildlife habitat.
